

Ceramic frit band and dot matrix

Both are fired ceramic enamel, but they do not perform exactly the same role.

COMPARISON

The band protects; the dots make the transition gradual

Solid black band

It surrounds the glass bonding zone.

UV protection

It protects the polyurethane adhesive from sunlight.

Hidden bond

It visually covers the adhesive line and body flange.

Dot matrix

It fades into the clear glass.

Thermal ramp

It reduces the heat-absorption step between black and clear glass during manufacture.

Visual ramp

It makes the transition from opaque edge to clear glass less abrupt.
