

A calm incident-response loop

Detect, decide, repair, learn

Each stage hands evidence to the next one; the flow is intentionally linear.

**Observe a
signal**

An alert, report or dashboard tells the team that behaviour changed.

**Triage
impact**

Confirm the user impact, current scope and the fastest safe owner.

**Apply a
repair**

Choose a reversible mitigation first, then make the durable change.

**Verify
recovery**

Check the original symptom, the affected journey and the system signals.

**Record
the
learning**

Capture the decision, evidence and follow-up while the context is fresh.
